**HUNTER**  
Engineering Company

Here's what Hawkeye International Trucks does to help you cut costs...

1. We use electronic sensors to measure individual toe on drive axle and determine thrust line.
2. We align that axle to point down the center of the frame.
3. We measure and align each of the other axles parallel to the reference axle—so all wheels roll in the same direction.

**Our computerized alignment system does even more:**

Electronically compensates each sensor for run-out and references

Includes: Setting toe on front axle, adjusting 3 axles including shims to proper alignment.

Electronic print out of all before & after measurements.

PROUDLY ALIGNED WITH HUNTER EQUIPMENT
